

The Value of Electromagnetic Transition Form Factors of Light Mesons

S. Schadmand

Nuclear Physics Institute, Forschungszentrum Juelich, Germany

Electromagnetic transition form factors are determined via meson decays into final states with dileptons. Form factors are evaluated as a function of the momentum transfer which is identical to the invariant mass of the dileptons. The results provide basic knowledge of the structure of hadrons and address the validity of vector meson dominance. The form factors are of special interest on account of the impact on the interpretation of the $g-2$ measurements. Here, light-by-light scattering is an important factor. The talk will include experimental results from the experiments WASA at COSY and CLAS6 at Jefferson Lab.
